## Using the inverse matrix to solve equations

## Introduction

One of the most important applications of matrices is to the solution of linear simultaneous equations. On this leaflet we explain how this can be done.

## 1. Writing simultaneous equations in matrix form

Consider the simultaneous equations

$$
\begin{array}{r}
x+2 y=4 \\
3 x-5 y=1
\end{array}
$$

Provided you understand how matrices are multiplied together you will realise that these can be written in matrix form as

$$
\left(\begin{array}{cc}
1 & 2 \\
3 & -5
\end{array}\right)\binom{x}{y}=\binom{4}{1}
$$

Writing

$$
A=\left(\begin{array}{cc}
1 & 2 \\
3 & -5
\end{array}\right), \quad X=\binom{x}{y}, \quad \text { and } \quad B=\binom{4}{1}
$$

we have

$$
A X=B
$$

This is the matrix form of the simultaneous equations. Here the unknown is the matrix $X$, since $A$ and $B$ are already known. $A$ is called the matrix of coefficients.

## 2. Solving the simultaneous equations

Given

$$
A X=B
$$

we can multiply both sides by the inverse of $A$, provided this exists, to give

$$
A^{-1} A X=A^{-1} B
$$

But $A^{-1} A=I$, the identity matrix. Furthermore, $I X=X$, because multiplying any matrix by an identity matrix of the appropriate size leaves the matrix unaltered. So

$$
X=A^{-1} B
$$

This result gives us a method for solving simultaneous equations. All we need do is write them in matrix form, calculate the inverse of the matrix of coefficients, and finally perform a matrix multiplication.

## Example

Solve the simultaneous equations

$$
\begin{array}{r}
x+2 y=4 \\
3 x-5 y=1
\end{array}
$$

## Solution

We have already seen these equations in matrix form:

$$
\left(\begin{array}{cc}
1 & 2 \\
3 & -5
\end{array}\right)\binom{x}{y}=\binom{4}{1}
$$

We need to calculate the inverse of $A=\left(\begin{array}{cc}1 & 2 \\ 3 & -5\end{array}\right)$.

$$
\begin{aligned}
A^{-1} & =\frac{1}{(1)(-5)-(2)(3)}\left(\begin{array}{cc}
-5 & -2 \\
-3 & 1
\end{array}\right) \\
& =-\frac{1}{11}\left(\begin{array}{cc}
-5 & -2 \\
-3 & 1
\end{array}\right)
\end{aligned}
$$

Then $X$ is given by

$$
\begin{aligned}
X=A^{-1} B & =-\frac{1}{11}\left(\begin{array}{cc}
-5 & -2 \\
-3 & 1
\end{array}\right)\binom{4}{1} \\
& =-\frac{1}{11}\binom{-22}{-11} \\
& =\binom{2}{1}
\end{aligned}
$$

Hence $x=2, y=1$ is the solution of the simultaneous equations.

## Exercises

1. Solve the following sets of simultaneous equations using the inverse matrix method.
a) $\begin{aligned} 5 x+y & =13 \\ 3 x+2 y & =5\end{aligned}$
b) $\quad \begin{aligned} 3 x+2 y & =-2 \\ x+4 y & =6\end{aligned}$

## Answers

1. a) $x=3, y=-2$,
b) $x=-2, y=2$.
